

Project Initialization and Planning Phase

Date	03 October 2026
Team ID	SWTID-2026-5999
Project Name	PocketSmart AI — AI-Assisted Goal-Based Budget Planner
Maximum Marks	3 Marks

Define Problem Statements

Project idea: PocketSmart AI is a budget-first planning assistant. Instead of asking the user to search for products first, it starts with the total amount the user is willing to spend and creates a practical allocation for the complete task. The plan is then checked by the application before it is shown.

Problem Statement	I am	I’m trying to	But	Because	Which makes me feel
PS-1	A person setting up a home on a fixed amount	Plan essential furniture and fittings without exhausting the budget early	I do not know how much to reserve for each requirement	Products are spread across several stores and prices vary widely	Uncertain about where to start
PS-2	Someone arranging a family or social event	Divide one event budget among venue, food, decoration and entertainment	One expensive decision can affect the rest of the event	Event costs are usually considered separately instead of as one plan	Worried about last-minute compromises
PS-3	A customer preparing for an occasion	Choose jewelry that suits the occasion and stays within a spending limit	Too many styles make comparison difficult	Online catalogues are large and rarely explain the trade-off between style and budget	Overloaded by choices
PS-4	A student or young professional with limited planning time	Get a usable spending plan quickly	Manual comparison takes too long	There is no single place that combines allocation, recommendations and budget checking	Frustrated by repetitive searching

Core Problem

People often know **how much they can spend**, but not **how that amount should be distributed**. PocketSmart AI addresses this gap by turning a total budget and a few practical preferences into a structured plan that can be reviewed, adjusted and used for shopping.
