

Problem-Solution Fit Canvas

Date	03 October 2026
Team ID	SWTID-2026-5999
Project Name	PocketSmart AI — AI-Assisted Goal-Based Budget Planner
Maximum Marks	5 Marks

Customer Segment	Customer Limitations	Existing Alternatives
Students, young professionals, families and first-time home planners who need to make a group of purchases within one fixed amount	Limited time, fixed spending limit, uncertainty about category-wise costs, many stores and service providers	Manual browsing, notes/calculators, spreadsheets, asking friends, single-store shopping

Problems / Pains	Root Cause	Current Behaviour
Users know the maximum amount but struggle to distribute it across several needs. Repeated comparison increases planning time.	Cost information and recommendations are fragmented; most shopping tools focus on individual items rather than the complete budget	Users open several tabs, make rough calculations, remove items after the total becomes too high and repeat the process

Triggers	Proposed Solution	Channels
Moving into a home, arranging an event, preparing for a wedding/festival or making a planned purchase	PocketSmart AI starts with the total budget, creates a category-wise plan using Gemini, verifies the total in the backend and provides search links for further shopping	Web browser, GitHub-hosted project, external retailer/service search pages

Before Using	After Using
Unclear allocation, too many choices, repeated calculations	A structured plan, visible category totals, remaining amount and saved history

Fit Statement

The proposed solution fits the problem because it focuses on the part that existing shopping sites do not solve together: **planning the whole spending limit before selecting individual items.**
